

EGFR-IN-169

## Chemical Properties

CAS No. :

Formula:

Molecular Weight:

Storage: Powder: -20°C for 3 years | In solvent: -80°C for 1 year

Actual storage temperature shall be subject to the COA.

## Biological Description

Description	EGFR-IN-169 is an epidermal growth factor receptor (EGFR) inhibitor derived from ginsenoside, with an IC50 of 5.19 $\mu$ M. It disrupts colorectal cancer cell migration and growth by inhibiting the EGFR-mediated RalA/EMT pathway. With an IC50 of 4.46 $\mu$ M against HCT-116 cells and a selectivity index (SI) of 16.92, EGFR-IN-169 also inhibits CDKs, induces G0/G1 cell cycle arrest, and suppresses cell migration and invasion. Additionally, EGFR-IN-169 reduces mitochondrial membrane potential, induces apoptosis and reactive oxygen species (ROS) production. It is applicable in cancer research, particularly for colorectal cancer.
Targets(IC50)	Apoptosis,EGFR,Bcl-2 Family,CDK,ROS
In vitro	EGFR-IN-169 (Compound 4e) exhibits an IC50 of 4.46 $\mu$ M in HCT-116 cells, 6.89 $\mu$ M in CT-26 cells, 9.03 $\mu$ M in HT-29 cells, 16.01 $\mu$ M in SW620 cells, and 18.98 $\mu$ M in Caco-2 cells. At concentrations of 5-10 $\mu$ M over 48 hours, it suppresses colony formation in HCT-116 and CT-26 cell lines. It induces significant G0/G1 phase arrest in HCT-116 cells at 2.5-10 $\mu$ M for 48 hours and triggers apoptosis in the same cells at 2.5-10 $\mu$ M for 24-48 hours. Additionally, EGFR-IN-169 causes mitochondrial damage and reactive oxygen species (ROS) accumulation in HCT-116 cells at 2.5-10 $\mu$ M over 12 hours. At 5 $\mu$ M for 48 hours, it inhibits migration and invasion of HCT-116 cells and suppresses RalA protein activation in a dose-dependent manner within these cells.
In vivo	EGFR-IN-169 (Compound 4e) demonstrates good safety at a dose of 100 mg/kg, administered once daily for 7-14 days in mice. Moreover, when given intraperitoneally at a dosage of 5-10 mg/kg, EGFR-IN-169 effectively inhibits tumor growth in the CT-26 tumor-bearing mouse model.
