Biological Description

Description	Vasopressin acetate is a peptide hormone with vasoconstrictive and antidiuretic activities that binds to the vascular arginine vasopressin receptor, V1, with Kd values of 1.31 and 1.44 nM in A7r5 rat aortic smooth muscle cells and neonatal rat cardiomyocytes, respectively
Targets(IC50)	Others
In vitro	Vasopressin stimulate NKCC2 phosphorylation increase mediated by cAMP-PKA and Ca (2+) signaling in the colon. The expression and phosphorylation of NKCC2 are increased in the colon by vasopressin stimulation, in association with enhanced activity of the vasopressin/cAMP and Ca(2+) pathways[1].
