

BMS 777607

## Chemical Properties

CAS No. : 1025720-94-8

Formula: C<sub>25</sub>H<sub>19</sub>ClF<sub>2</sub>N<sub>4</sub>O<sub>4</sub>

Molecular Weight: 512.89

Storage: Keep away from moisture, Store at low temperature  
Powder: -20°C for 3 years | In solvent: -80°C for 1 year

Actual storage temperature shall be subject to the COA.

## Biological Description

Description	BMS 777607 (BMS 817378) is a Met-related inhibitor targeting c-Met, Axl, Ron, and Tyro3 with IC <sub>50</sub> values of 3.9 nM, 1.1 nM, 1.8 nM, and 4.3 nM, respectively. BMS-777607 has been investigated in basic science research for malignant solid tumors.
Targets(IC <sub>50</sub> )	c-Met/HGFR, TAM Receptor
In vitro	BMS-777607 did not affect tumor cell growth much, it inhibited hepatocyte growth factor-induced cell dispersal in PC-3 and DU145 cells, it also dose-dependently inhibited cell migration and invasion (IC <sub>50</sub> <0.1 μM). BMS-777607 is a selective ATP-competitive Met kinase inhibitor, it has strong inhibition of c-Met autophosphorylation, the IC <sub>50</sub> of GTL-16 cell lysates is 20 nM, and it inhibits Met-driven tumor cell lines such as GTL-16 cell line, H1993 and U87 cells. , with an IC <sub>50</sub> of 20 nM for GTL-16 cell lysates and selective inhibition of proliferation of Met-driven tumor cell lines such as GTL-16 cell line, H1993 and U87 cells. In DU145 prostate cancer cells, BMS-777607 inhibited c-Met autophosphorylation induced by hepatocyte growth factor (HGF) (IC <sub>50</sub> <1 nM). BMS-777607 (1 μM) treatment for 24 h effectively inhibited KHT cell dispersal, motility, and invasion, which was associated with the inhibition of the MET gene, and had a certain effect on cell proliferation and colony formation. This is related to the inhibition of MET gene and has certain effects on cell proliferation and colony formation. In highly metastatic murine KHT cells, BMS-777607 (10 μM) treatment for 2 h effectively cleared the level of autophosphorylated c-Met (IC <sub>50</sub> : 10 nM) without affecting the whole c-Met, which dose-dependently inhibited downstream signaling molecules including ERK, Akt, p70S6K and S6.
In vivo	BMS-777607 did not affect tumor cell growth much, it inhibited hepatocyte growth factor-induced cell dispersal in PC-3 and DU145 cells, it also dose-dependently inhibited cell migration and invasion (IC <sub>50</sub> <0.1 μM). BMS-777607 is a selective ATP-competitive Met kinase inhibitor, it has strong inhibition of c-Met autophosphorylation, the IC <sub>50</sub> of GTL-16 cell lysates is 20 nM, and it inhibits Met-driven tumor cell lines such as GTL-16 cell line, H1993 and U87 cells. , with an IC <sub>50</sub> of 20 nM for GTL-16 cell lysates and selective inhibition of proliferation of Met-driven tumor cell lines such as GTL-16 cell line, H1993 and U87 cells. In DU145 prostate cancer cells, BMS-777607 inhibited c-Met autophosphorylation induced by hepatocyte growth factor (HGF) (IC <sub>50</sub> <1 nM). BMS-777607 (1 μM) treatment for 24 h effectively inhibited KHT cell dispersal, motility, and invasion, which was associated with the inhibition of the MET gene, and had a certain

In vivo	effect on cell proliferation and colony formation. This is related to the inhibition of MET gene and has certain effects on cell proliferation and colony formation. In highly metastatic murine KHT cells, BMS-777607 (10 µM) treatment for 2 h effectively cleared the level of autophosphorylated c-Met (IC50: 10 nM) without affecting the whole c-Met, which dose-dependently inhibited downstream signaling molecules including ERK, Akt, p70S6K and S6.
Kinase Assay	Met Kinase Assay: The kinase reaction consists of baculovirus expressed GST-Met, 3 µg of poly(Glu/Tyr), 0.12 µCi 33P γ-ATP, 1 µM ATP in 30 µL of kinase buffer (20 mM Tris-Cl, 5 mM MnCl <sub>2</sub> , 0.1 mg/mL BSA, 0.5 mM DTT). Reactions are incubated for 1 hour at 30 °C and stopped by the addition of cold trichloroacetic acid (TCA) to a final concentration of 8%. TCA precipitates are collected onto GF/C unifier plates using a Filtermate universal harvester, and the filters are quantitated using a TopCount 96-well liquid scintillation counter. Dose response curves are generated to determine the concentration required to inhibit 50% of substrate phosphorylation (IC50). BMS 777607 is dissolved at 10 mM in dimethylsulfoxide (DMSO) and evaluated at 10 concentrations, in duplicate.
Cell Research	KHT cells are exposed to serial dilution of BMS 777607 for 96 hours, then the MTT assay and trypan blue exclusion are used for the determination of cell proliferation and cell death, respectively. KHT cell colonies are incubated with BMS 777607 for 24 hours and then stained with crystal violet (0.1%) and photographed for the assessment of cell scattering. 2 mm scratch on the confluent KHT cell monolayer is made using a sterilized 1 ml pipette tip followed by treated with BMS-777607 for 24 hours, then the number of cells that have migrated into the denuded area is counted on 4 random fields for the evaluation of cell migration. For the examination of cell invasion, the commercial transwell inserts (8 µm pore membrane) pre-loaded with Matrigel are incubated with serum-free medium in the presence or absence of BMS 777607 at 37 °C for 2 hours to allow rehydration of Matrigel. Then cells suspended in serum-free medium are loaded onto the top chamber (5 × 10 <sup>3</sup> /insert) and complete medium (containing 10% FBS) is used in the lower chamber as a chemoattractant. After incubation for 24 hours, the Matrigel is removed and the inserts are stained with crystal violet. Invaded cells on the underside of the filter are photographed and counted. (Only for Reference)

### Solubility Information

Solubility	Ethanol: < 1 mg/mL (insoluble or slightly soluble), H <sub>2</sub> O: < 1 mg/mL (insoluble or slightly soluble), DMSO: 127.5 mg/mL (248.59 mM), Sonication is recommended. (< 1 mg/ml refers to the product slightly soluble or insoluble)
In vivo Formulation	10% DMSO+90% Saline: < 10 mg/mL (19.5 mM), Lower concentrations may be soluble, but exact solubility limit is unknown. 10% DMSO+40% PEG300+5% Tween 80+45% Saline: 10 mg/mL (19.5 mM), Solution. <i>Please add the solvents sequentially, clarifying the solution as much as possible before adding the next one. Dissolve by heating and/or sonication if necessary. Working solution is recommended to be prepared and used immediately. The formulation provided above is for reference purposes only. In vivo formulations may vary and should be modified based on specific experimental conditions.</i>

### Preparing Stock Solutions

---

	<b>1mg</b>	<b>5mg</b>	<b>10mg</b>
1 mM	1.9497 mL	9.7487 mL	19.4974 mL
5 mM	0.3899 mL	1.9497 mL	3.8995 mL
10 mM	0.195 mL	0.9749 mL	1.9497 mL
50 mM	0.039 mL	0.195 mL	0.3899 mL

---

Please select the appropriate solvent to prepare the stock solution, according to the solubility of the product in different solvents. Please use it as soon as possible.

Note: The dilution table applies only to solid products. For liquid products, please calculate the stock solution based on the stated concentration and/or density.
