Biological Description

Description	PEG3-methylamine is a PEG-based linker for PROTACs, joining two essential ligands and facilitating selective protein degradation via the ubiquitin-proteasome system within cells.
Targets(IC50)	PROTAC Linker
In vitro	PROTACs utilize two distinct ligands connected by a linker: one ligand targets an E3 ubiquitin ligase, while the other binds to the target protein. By leveraging the intracellular ubiquitin-proteasome system, PROTACs facilitate the selective degradation of target proteins [1].
