

GLPG0492

Chemical Properties

CAS No. : 1215085-92-9
Formula: C₁₉H₁₄F₃N₃O₃
Molecular Weight: 389.33
Appearance: no data available
Storage: Powder: -20°C for 3 years | In solvent: -80°C for 1 year

Biological Description

Description	GLPG0492 is a novel selective androgen receptor modulator. After oral dosing, it showed anabolic activity on muscle, strongly dissociated from the androgenic activity on the prostate.
Targets(IC50)	Androgen Receptor
In vitro	GLPG0492 is a new non-steroidal selective androgen receptor modulator that is currently under development for musculo-skeletal diseases such as sarcopenia and cachexia. GLPG0492 was found as efficacious as TP at reducing muscle loss while sparing reproductive tissues. GLPG0492 treatment partially prevents immobilization-induced muscle atrophy with a trend to promote muscle fiber hypertrophy in a dose-dependent manner. AR modulator GLPG0492 has very good pharmacokinetic properties, including bioavailability in rat (F > 50%), and is currently under evaluation in phase I clinical trials [1]. A surrogate of the 6-min walking test used in DMD patients, GLPG0492 preserved running performance, in acute exhaustion tests. Whereas vehicle- or comparator-treated animals showed a significant increase in fatigue (30-50%) [2]. Furthermore, gene expression studies performed on tibialis samples revealed that both GLPG0492 and TP were slowing down muscle loss by negatively interfering with major signaling pathways controlling muscle mass homeostasis [3].

Solubility Information

Solubility	DMSO: 45mg/mL (115.6mM), (< 1 mg/ml refers to the product slightly soluble or insoluble)
