Biological Description

Description	Nitromifene is the estrogen receptor antagonist.
Targets(IC50)	Others
In vitro	Nitromifene is an effective antagonist of the ability of calmodulin (CM) to activate cyclic nucleotide phosphodiesterase. Nitromifene inhibits MCF 7 cell proliferation to 70% of that in drug-free controls, at 0.5 µM and 1.0 µM concentrations. Nitromifene is clearly more effective than other metabolites, at higher concentrations. Specifically, bound estradiol is displaced from intact MCF 7 cells by Nitromifene.
