

PD-166793

Chemical Properties

CAS No. : 199850-67-4
Formula: C₁₇H₁₈BrNO₄S
Molecular Weight: 412.3
Appearance: no data available
Storage: store at low temperature
Powder: -20°C for 3 years | In solvent: -80°C for 1 year

Biological Description

Description	PD-166793 is an orally active, potent and selective MMP inhibitor with inhibitory effects on MMP-2, MMP-3 and MMP-13. PD-166793 ameliorates myocardial ischemia and reperfusion injury in a rat model of heart failure. PD-166793 is an orally active, potent and selective MMP inhibitor with inhibitory effects on MMP-2, MMP-3, and MMP-13.
Targets(IC ₅₀)	MMP
In vitro	In rat heart homogenates, PD-166793 at a concentration of 0.1 μM results in a 20% inhibition of AMP deaminase (AMPD) activity[2]. Additionally, when normal human cardiac fibroblasts are treated with PD-166793 at a concentration of 100 μM for 36 hours, there is a significant reduction in MMP-9 activity[1].
In vivo	Administered at a dosage of 1 mg/kg per day through daily gavage for a duration of 10 weeks, PD-166793 largely prevents the adverse remodeling typically observed in the aortocaval (AV) fistula model[3]. Furthermore, in rats, PD-166793 administered at a dose of 5 mg/kg via oral gavage demonstrates superior pharmacokinetics, with a half-life (t _{1/2}) of 43.6 hours, a maximum concentration (C _{max}) of 42.4 μg/mL, and an area under the curve from 0 to infinity (AUC _{0-∞}) of 2822 μg·h/mL[2].

Solubility Information

Solubility	DMSO: 80 mg/mL(194.03 mM), Sonication is recommended. (< 1 mg/ml refers to the product slightly soluble or insoluble)
