

Org 27569

Chemical Properties

CAS No. : 868273-06-7

Formula: C₂₄H₂₈ClN₃O

Molecular Weight: 409.95

Appearance: no data available

Storage: Powder: -20°C for 3 years | In solvent: -80°C for 1 year

Biological Description

Description	Org 27569, an allosteric modulator of cannabinoid CB1 receptor, can induce a CB1 receptor state that is characterized by decreased inverse agonist affinity and enhanced agonist affinity.
Targets(IC50)	Cannabinoid Receptor
In vivo	ORG 27569 (3.2 and 5.6 mg/kg, intraperitoneally) significantly reduces both cue-induced and priming-induced reinstatement of cocaine and methamphetamine in rats[4]. At a dosage of 30 mg/kg, intraperitoneally, Org27569 induces appetite suppression independent of CB1 receptors and does not alter the discriminative stimulus effects of anandamide (AEA). Furthermore, an intracerebroventricular administration of Org27569 (100 µg) does not influence the pharmacological effects of CP55,940 administered systemically when compared to a vehicle[5].
Kinase Assay	Equilibrium Binding Assays.: Binding assays are performed with the CB1 receptor agonist [3H]CP 55,940 (0.7 nM) and the CB1 receptor antagonist [3H]SR 141716A (1.2 nM), 1 mg/ml BSA and 50 mM Tris buffer containing 0.1 mM EDTA and 0.5 mM MgCl ₂ , pH 7.4, in a total assay volume of 500 µl. Binding is initiated by the addition of mouse brain membranes (30 µg). Assays are carried out at 37°C for 60 min before termination by addition of ice-cold wash buffer (50 mM Tris buffer and 1 mg/ml BSA) and vacuum filtration using a 24-well sampling manifold and Whatman GF/B glass-fiber filters that have been soaked in wash buffer at 4°C for 24 h. Each reaction tube is washed five times with a 4-ml aliquot of buffer. The filters are oven-dried for 60 min and then placed in 5 ml of scintillation fluid, and radioactivity is quantitated by liquid scintillation spectrometry. Specific binding is defined as the difference between the binding that occurred in the presence and absence of 1 µM concentrations of the corresponding unlabeled ligand and is 70 to 80% of the total binding.
Cell Research	Cells expressing CB1 receptors are exposed to ORG27569 (10 µM) for 5 to 15 min. For toxin treatment to abrogate Gi coupling effects, PTX is added to the medium at 5 ng/ml. Following an 18-h incubation in the presence of toxin, cells are washed twice with PBS and treated with compounds. Cells are washed with ice-cold PBS, and cell lysates are obtained by harvesting the cells with ice-cold lysis buffer (150 mM NaCl, 1.0% IGEPAL CA-630, 0.5% sodium deoxycholate, 0.1% SDS, and 50 mM Tris, pH 7.5 containing 4-(2-aminoethyl)benzenesulfonyl fluoride, pepstatin A, E-64, bestatin, leupeptin, and aprotinin as protease inhibitors).(Only for Reference)

Solubility Information

Solubility	DMSO: 41 mg/mL (100 mM), (< 1 mg/ml refers to the product slightly soluble or insoluble)
