Biological Description

Description	Rosiglitazone hydrochloride (BRL-49653 HCl) is a blood glucose-lowering drugs, stimulating insulin secretion by binding to the PPAR receptors in fat cells.
Targets(IC50)	Ferroptosis,TRP/TRPV Channel,PPAR,Autophagy
In vitro	Bafetinib blocks WT Bcr-Abl autophosphorylation and its downstream kinase activity with IC50 of 11 nM and 22 nM in K562 and 293T cells, respectively. Bafetinib suppresses the growth of the Bcr-Abl-positive cell lines including K562, KU812, and BaF3/wt cells potently without effects on the proliferation of the Bcr-Abl-negative U937 cell line. Moreover, Bafetinib exhibits a dose-dependent antiproliferative effect against Bcr-Abl point mutant cell lines, such as BaF3/E255K cells. [1] In Bcr-Abl+ leukemia cell lines, Bafetinib induces both caspase-mediated and caspase-independent cell death by blocking the phosphorylation of Bcr-Abl. [2]
