Biological Description

Description	JS25 is a selective, covalent BTK inhibitor that deactivates BTK by chelating Tyr551, exhibiting an IC ₅₀ of 5.8 nM. It suppresses cancer cell proliferation, induces pronounced cell death, and enhances Burkitt's lymphoma murine xenograft model outcomes. Importantly, JS25 efficiently penetrates the blood-brain barrier.
In vitro	The 3-Hydroxybutyric acid medium can interact with lipids (using DPPC monolayer modeling) and alter phase behavior at clinical concentrations. The 3-Hydroxybutyric acid solid also reduces the interfacial viscosity of the DPPC monolayer.[1]
